

## mcHF back panel

The back panel provides support for the speaker and mounts onto the back support shell.

## Assembly

The back panel mounts with four M2.5x6mm bolts onto the support shell.

It is good idea to pre-drill the holes with 2.5mm drill bit.

Then attach the speaker via heating the mount pins

Or if those haven't printed well (as in my case), use piece of wire

Much better mounting would be with bolts and nuts, but looks much better from the outside if there is nothing sticking out. Of course this could be easily added, without any change to the STL file.

Finally the panel should fit perfectly to the back of the assembly
